

# Johnson Controls Climate Change Policy

FACILITY SITING STATEMENT

November 2024

Johnson Controls is committed to delivering smart, healthy and sustainable buildings. As part of our efforts to deliver products and solutions that fulfill this commitment, Johnson Controls reviews facility siting to fully understand the climate, land-use change, biodiversity, and nature implications associated with development. To that end, Johnson Controls prioritizes retrofit opportunities and minimizes greenfield development opportunities whenever possible. Site selection management begins with optimizing current locations to mitigate greenfield development to the greatest extent practicable.

Johnson Controls follows a three-point plan to minimize the impact of development and ensure that development mitigates emissions and impact on nature, in priority order:

Find development opportunities that retrofit and transform existing floorspace.

Find development opportunities that add floorspace to existing sites.

Find development opportunities that add floorspace to new sites best suited to minimizing the emissions and nature impacts of that development.
